## PRIMARY SCIENCE INTERESTS

- **Long Science:** Establish a culture of “Long Science” in multi-disciplinary research, as a counter to short-term monetary and political imperatives. Design and communicate scientific processes and outputs for tangible local use, decision-making, and impact.
- **Elevation gradients:** Real-time environmental monitoring of elevation gradients and climate refugia. Expansion of comparable sensor-based observatories within mountain environments. Encourage wide data distribution for stakeholders at local to international levels; validation of climate response hypotheses from the organism to watershed scales.
- **Ephemeral snowpacks and precipitation processes:** Discrimination of the rain/snow phase transition and monitoring snow water-equivalent (SWE) using in-situ sensory techniques at the local- to watershed-scale. Development of new sensor systems, techniques, and image-processing tools.
- **Regional paleo-hydroclimate:** Observe and evaluate annual-to-decadal shifts in seasonal climate/hydrology, and evaluate response of vegetation growth activity. Identify key months/weeks of soil/ecological drought, and forms of relief related to synoptic circulation and precipitation event characteristics.
- **Digital Wide-Area Science:** Application of distributed cost-effective multi-sensor networks at the watershed to regional scales. Development of Quality Control and Assurance tools. Leverage unmanned aircraft systems (UAS) for data acquisition and infrastructure management.
- **Dendrochronology study design:** Multi-elevational dendrohydrology in semi-arid environments. Millennial-length climatically-sensitive tree-ring records from multiple elevations in discrete watersheds evaluated for snowpack/water-supply variability over time. Development of new long chronologies, planning for permanent instrumentation, data geared towards seasonal water-balance models.
- **Regional high-elevation pines:** Development of long tree-ring chronologies from unique populations of five-needle pine in the Great Basin of North America. Compare with existing networks of chronologies and evaluate long-term trends in synoptic patterns. Discover outlier populations of Great Basin bristlecone pine (*Pinus longaeva*) and evaluate their growth responses.
